Before attempting a factory reset, try troubleshooting the issue with these step-by-step procedures. The first suspect is usually battery-related problems. Ensure that the batteries are correctly installed, fully charged, and properly aligned. Use non-rechargeable alkaline batteries for better performance. Follow our battery replacement guide for more instructions. If replacing batteries doesn't solve the issue, consider: * Loose battery tray * Disconnected or pinched cable * Incorrect battery installation * Mixing old and new batteries * Dust or dirt on contacts Resolve these issues and try again. For smart models that connect to Wi-Fi (like Encode Plus and Encode), weak signal strength or incorrect network settings can cause connectivity problems. To diagnose the issue, check your phone's Wi-Fi signal near the lock. If it's weak, restart your router by unplugging it for 30 seconds before plugging it back in. Clear any objects blocking the signal or install Wi-Fi extenders to boost the signal. Remember that Schlage smart locks only work with a 2.4 GHz network, so double-check your connection and ensure you're using the correct password when linking the lock to your Wi-Fi. Test the password on another device and update it in the app if necessary. Make sure your phone has the latest version of the Schlage app installed and is up-to-date with pending updates.ARTICLE Incorrect lock installations, loose cables, and faulty power sources can cause various issues with your Schlage smart lock. If you're experiencing keypad malfunctions, try resetting the circuit board or performing a factory reset according to the manufacturer's instructions. However, if the problem persists, don't hesitate to reach out to customer service for further assistance.
